# Formering

# Bakteriers overlevelsesmekanismer

Dannelse av endosporer

Biofilm

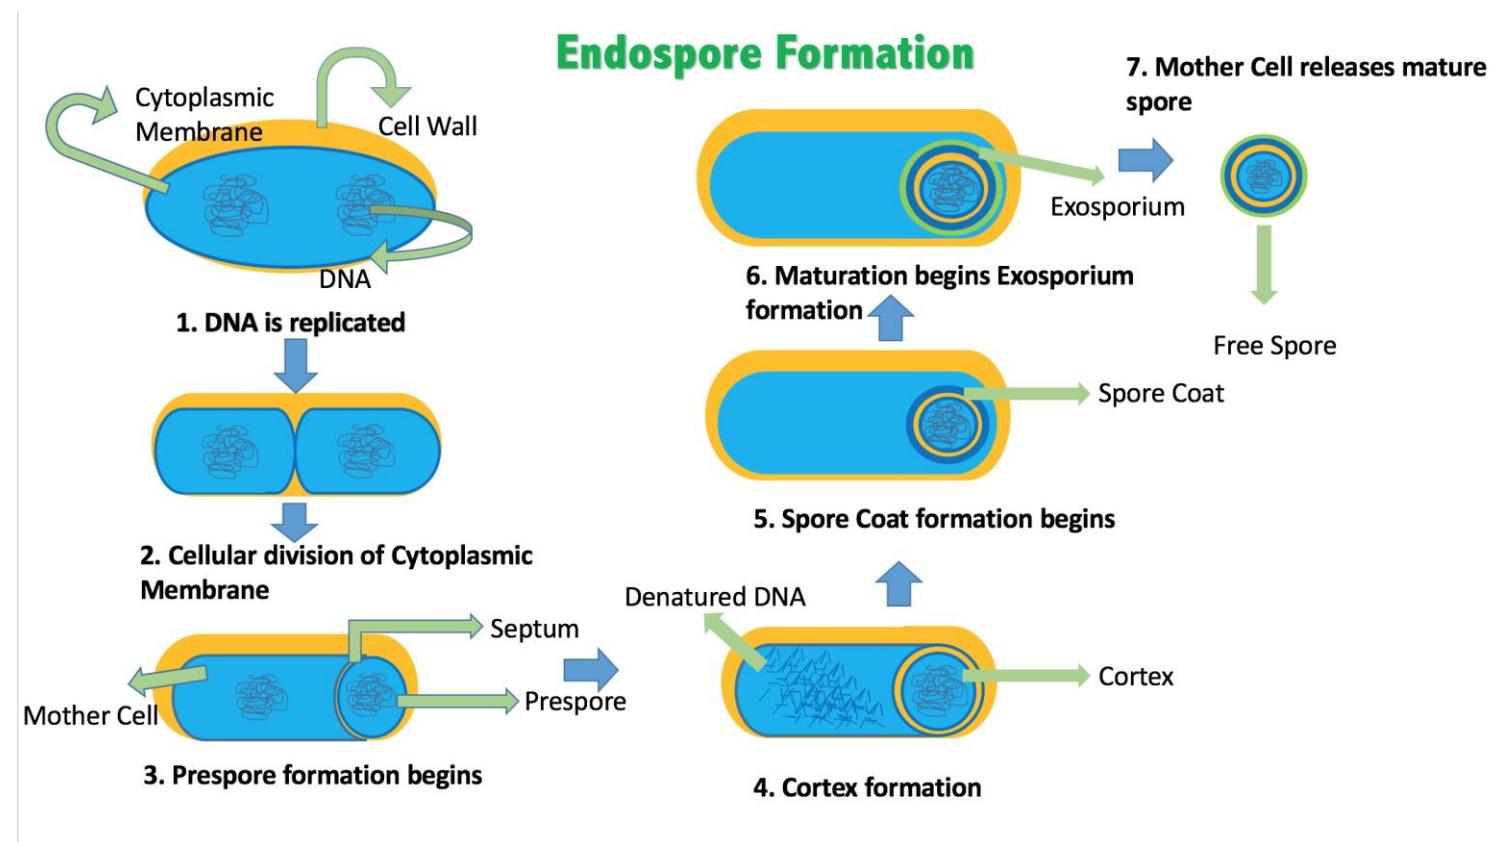

Antibiotikaresistens

# Bakteriesporer

- Enkelte bakterier kan danne sporer når vekstforholdene blir dårlige
- Ekstremt motstandsdyktige mot tørke, varme, stråling og giftstoffer – inkludert noen desinfeksjonsmidler
- Kan overleve i årevis uten noen form for næring

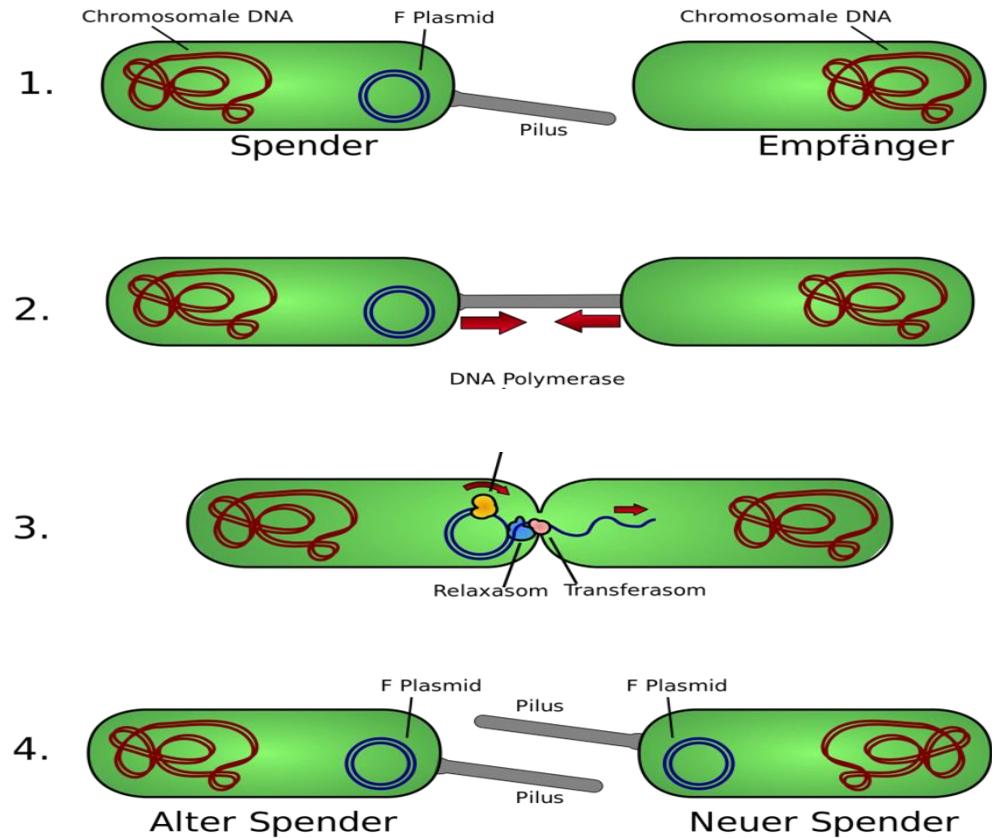

# Biofilm

- Belegg av mange forskjellige typer bakterier som fester seg til underlag og danner en glatt overflate
- Kan dannes på medisinsk utstyr som katetre og endoskop, i vannrør, kjøletårn osv.
- Mikroorganismene festes tett sammen i en matriks som gjør at biofilmen blir svært vanskelig å fjerne med desinfeksjonsmidler, må derfor ofte fjernes mekanisk

# Antibiotikaresistens

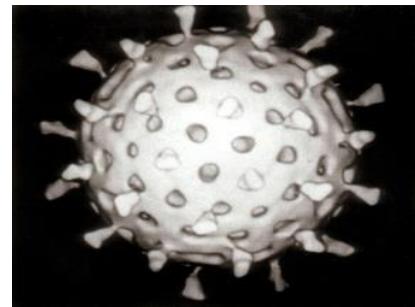

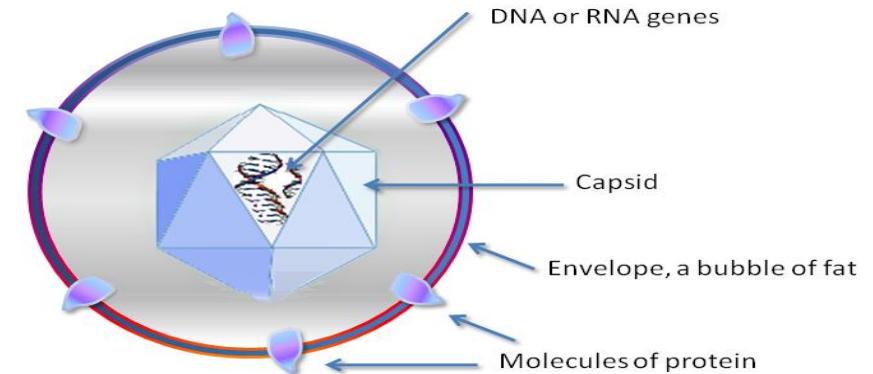

- Bakterier som motstår virkningen av antibiotika
- Antibiotikaresistens kan oppstå:
  - Naturlig
  - Ervervet
    - Genoverføring
    - Mutasjoner

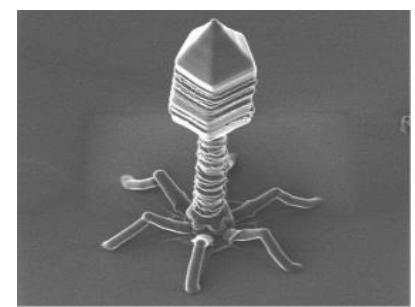

<https://upload.wikimedia.org/wikipedia/commons/c/c2/Konjugation.svg>: Adenosinederivative work: Matthias M., CC BY-SA 3.0 <<https://creativecommons.org/licenses/by-sa/3.0/>>, via Wikimedia Commons

# Virus

- Kan infisere alle livsformer
- Størrelse: 0,02- 0,3 µm
- Kan ikke sees i vanlig lysmikroskop
- Enkel struktur:
  - DNA/RNA
  - Proteinkapsel
  - (Lipidkappe)
- Virus er avhengig av en levende celle for å formere seg
- Virus uten lipidkappe er vanskeligere å inaktivere

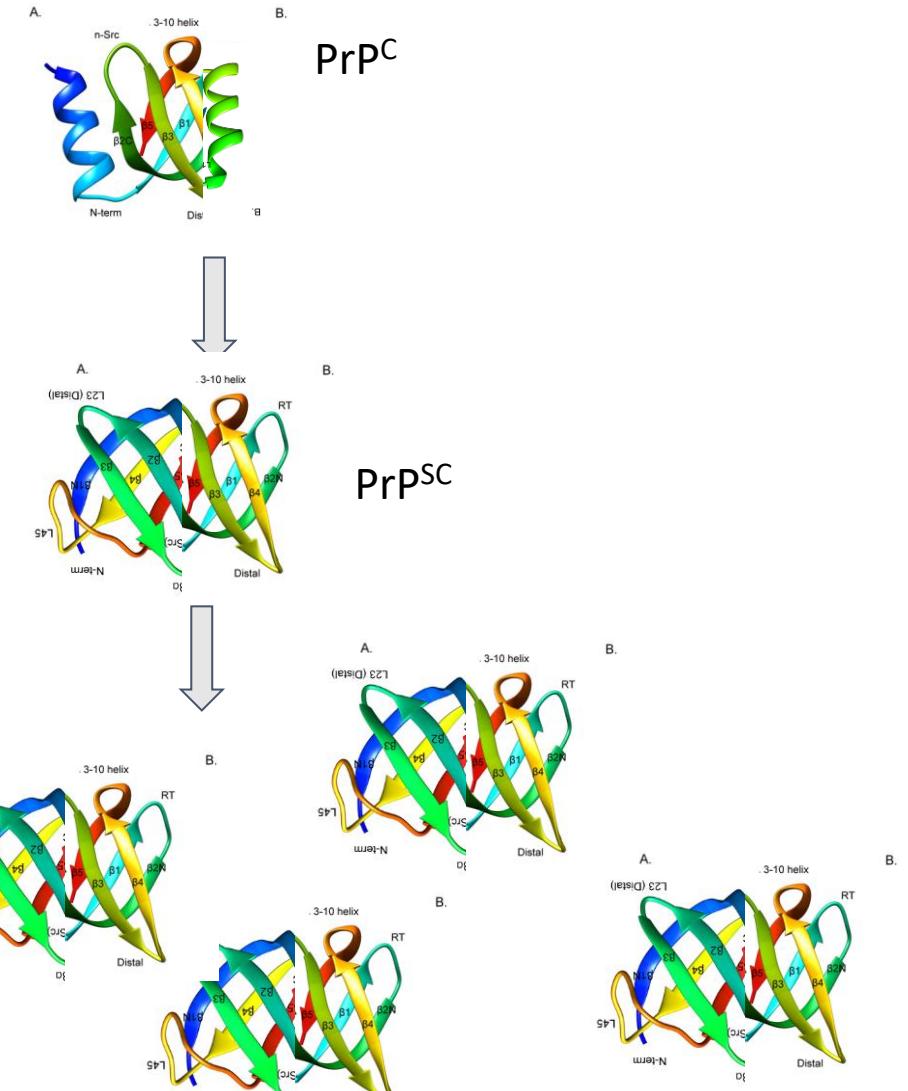

Rotavirus

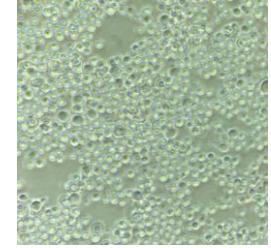

Bakteriofag

# Prioner

- Proteiner som finnes hos organismer med cellekjerne
- Er kun farlig i «unormal» form
- Kan oppstå spontant, arves og overføres
- Kan ikke ødelegges med tradisjonelle steriliseringsmetoder

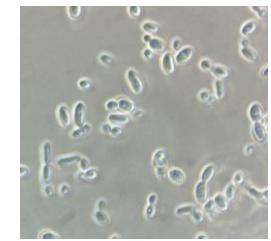

# Mikroskopiske sopper

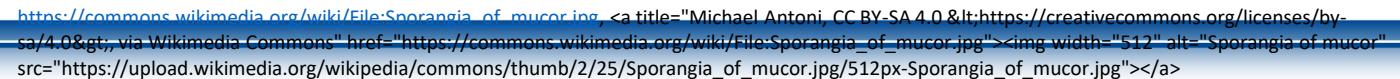

- Overflatiske soppinfeksjoner – dermatofytter og gjærsopp
- Subkutane soppinfeksjoner
- Sopper som gir dype infeksjoner

Inhalering, hudkontakt eller sår

- Infeksjon i hud og slimhinner
  - Fotsopp, ringorm
- Allergi
- Respiratoriske problemer
- Systemiske soppinfeksjoner
  - Alvorlige lidelser som angriper indre organer, oftest hos immunsupprimerte
